Northeastern Illinois is diverse in its land use and complex in its political structure. It has some of the most productive farms on earth—also one of the world's greatest cities. It contains 3,714 square miles of land and 38 square miles of water. It is home to 7.8 million people representing 65 percent of the total population of Illinois, and it is organized in more than 1,250 units of government.

In 1957, following a decade of rapid urbanization in the Chicago suburban area, the Illinois General Assembly created the Northeastern Illinois Planning Commission (NIPC) to conduct comprehensive planning for the six-county greater Chicago region.

The Commission has three statutory charges: conduct research and collect data for planning; assist local government; and prepare comprehensive plans and policies to guide development of the counties of Cook, DuPage, Kane, Lake, McHenry, and Will.

By necessity, regional planning deals with general development policies, not local land use detail. NIPC supports and coordinates county and municipal planning. The Commission has advisory powers only and relies upon voluntary compliance with its plans and policies.

Introduction

On September 27, 2000, the Northeastern Illinois Planning Commission (NIPC) endorsed updated forecasts of population, households and employment for the six-county Chicago metropolitan region. NIPC forecasts that in the year 2020, the region will be home to 9,045,000 people and 5,280,000 jobs. These represent increases of 1.78 million people (25 percent) and 1.43 million jobs (37 percent) from 1990 levels (Figure 1).

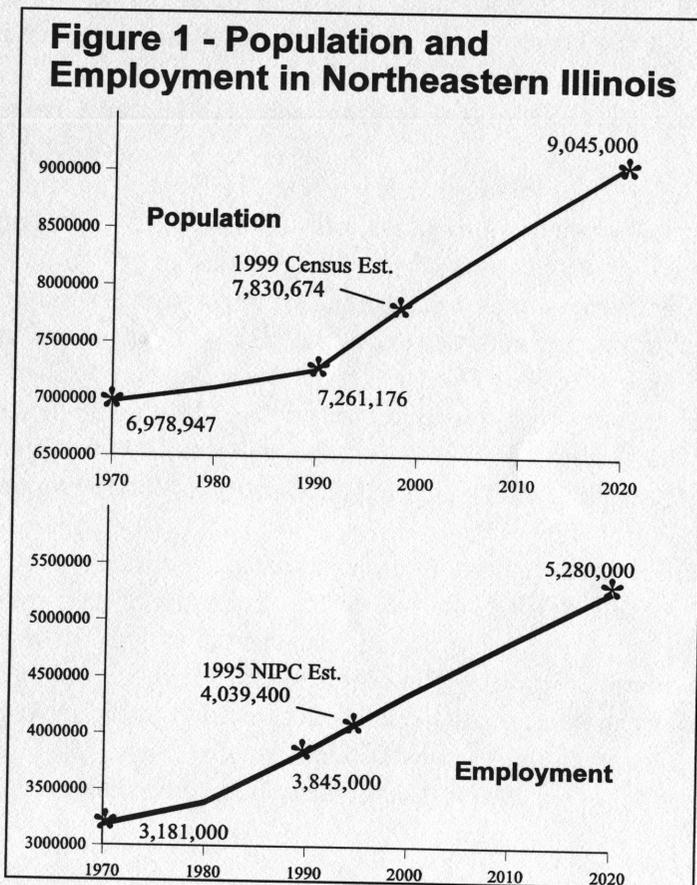

The regional forecasts of people and jobs are identical to those endorsed by the Commission in November 1997. Because data from the 2000 Census were not available, the updating process sought only to identify compelling reasons to adjust the 1997 numbers. Based on estimates of growth in population and jobs and on information on recent development activity, the regional totals were confirmed. The forecast of households was revised downward slightly to reflect a halt (at least temporarily) in the decline in household size. Following publication of the full 2000 Census results, NIPC will develop new forecasts to the year 2030. These will be endorsed in late 2003.

The Commission's forecasts are used to support a variety of public and private decisions. They play a pivotal role in planning decisions for transportation, air quality, water supply, and water quality.

The objective of the forecasting program is to produce forecasts of people and jobs and their distribution across the region that are *most likely* to occur. The Commission recognizes that the actual future levels and distribution of population and jobs will reflect countless private sector decisions as well as governmental policy and investment actions.

Regional Forecasts: Continuation of Strong Growth

The forecasts suggest a continuation of the strong population growth experienced in northeastern Illinois in the past decade. The Census Bureau estimates that the six-county area grew by 569,500 people or almost 8 percent between 1990 and 1999. This is in sharp contrast to the 20-year period between 1970 and 1990, when population increased by only 282,230 or 4 percent. The employment forecasts also suggest the extension of a trend of strong growth. Between 1970 and 1990, jobs increased by 664,000 or 21 percent. NIPC's estimates are that employment grew from 1990 to 1995 by 194,000 or 5 percent.

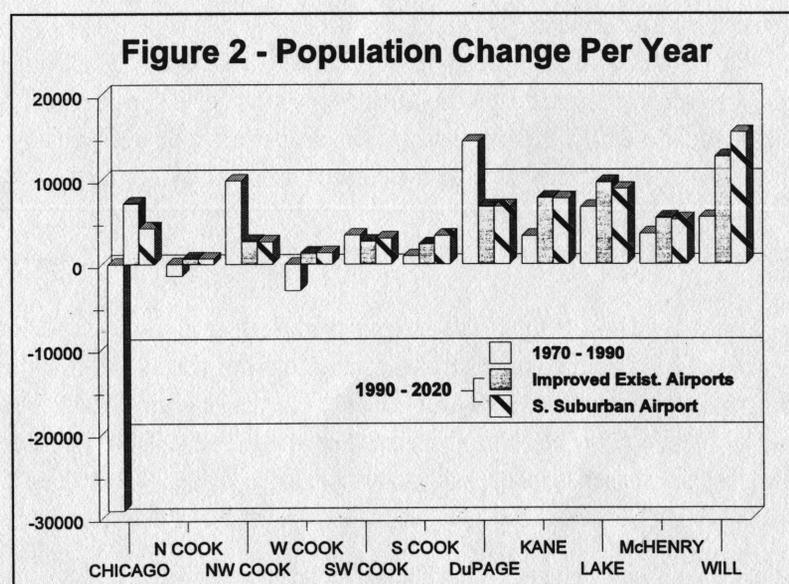

The employment forecasts assume that northeastern Illinois will maintain its share of national economic growth. They also assume that the region's growth will not be constrained by limitations in air service capacity. The 1997 forecasts of jobs by employment type have been revised to reflect the slowing growth in retail and accelerating growth in the service industries.

It is noteworthy that during the 1970's and 1980's, employment grew while population remained essentially stable. This occurred as the "baby boom" generation and a large number of women entered the labor force. This pool of available workers has now been absorbed. As a result, sustained employment growth will result in equivalent rates of population growth.

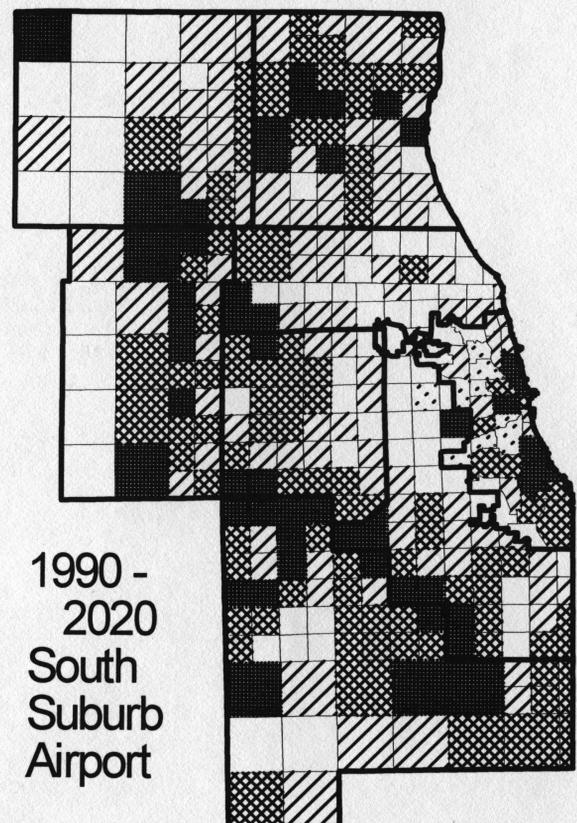

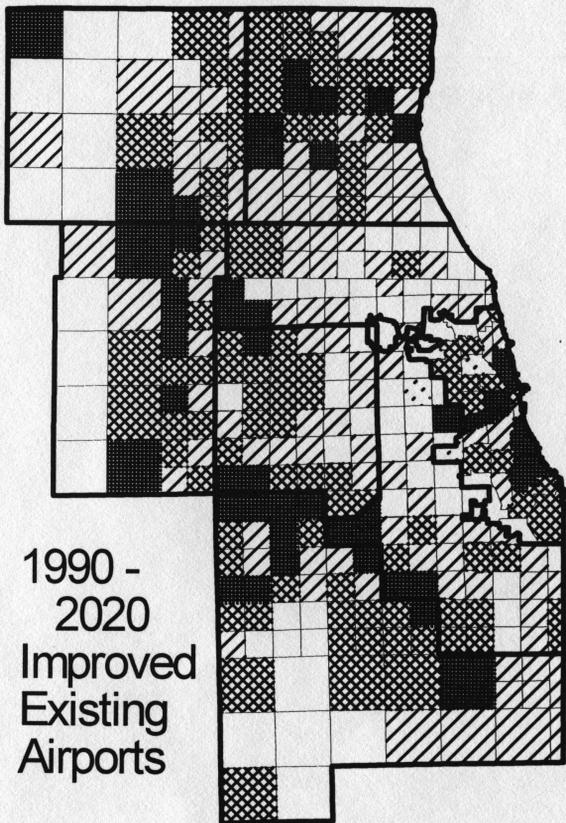

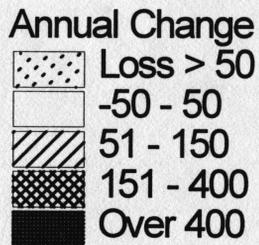

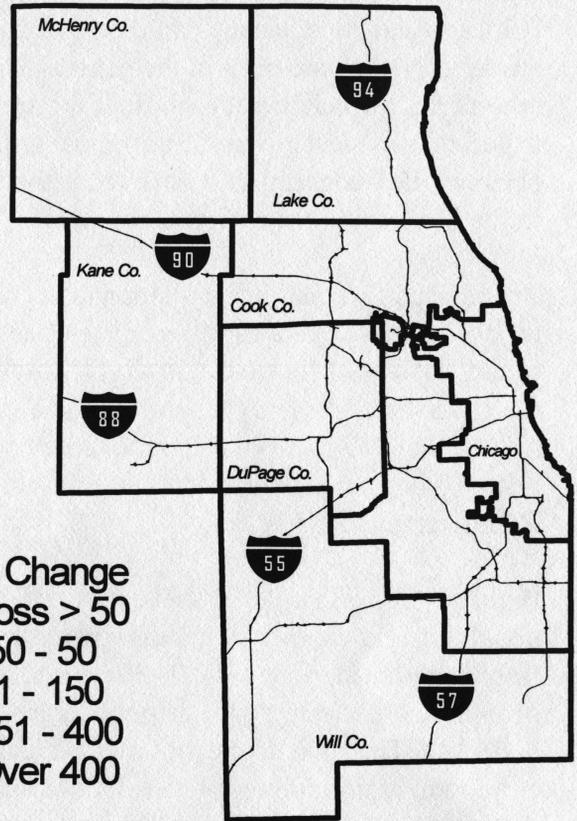

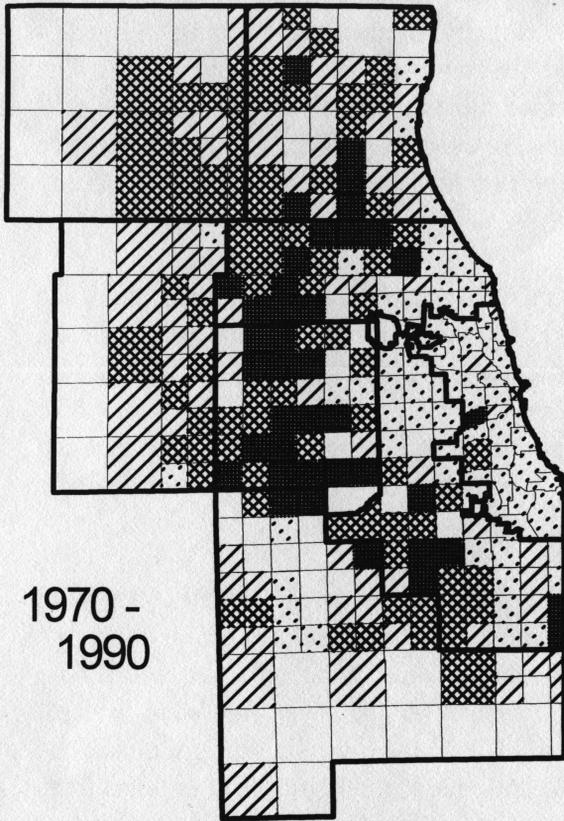

Forecasts Within the Region: More Balanced Growth

The updated forecasts indicate that population and employment growth will occur in all parts of the metropolitan region. Most noteworthy is the expectation that Chicago and many older suburbs will show positive gains while strong suburban growth continues. This confirms the 1997 forecasts, which represented a departure from prior trends. Between 1970 and 1990, Chicago and 90 mature suburban communities lost population while newer suburban areas experienced rapid growth in both people and jobs. The 1997 forecasts reflected the Commission's expectation that public policy and investment will give increased emphasis to the maintenance of existing communities, revitalization of declining areas, and cost-effective and environmentally-sensitive development throughout northeastern Illinois. That expectation is carried forward into the revised forecasts.

The subregional population forecasts and change over time are shown in Figure 2 and Map Set 1. Two alternative distributions of the regional total were prepared. One assumes that growth in demand for commercial air transportation will be satisfied through improvements at O'Hare and Midway Airports. The other assumes that the South Suburban Airport will be developed. Both alternatives forecast population growth in every sector of the region. In raw numbers, the greatest gains in population will occur in Cook and Will counties. Will and McHenry counties will experience the largest percentage gains in population.

Map Set 1 - Population Change

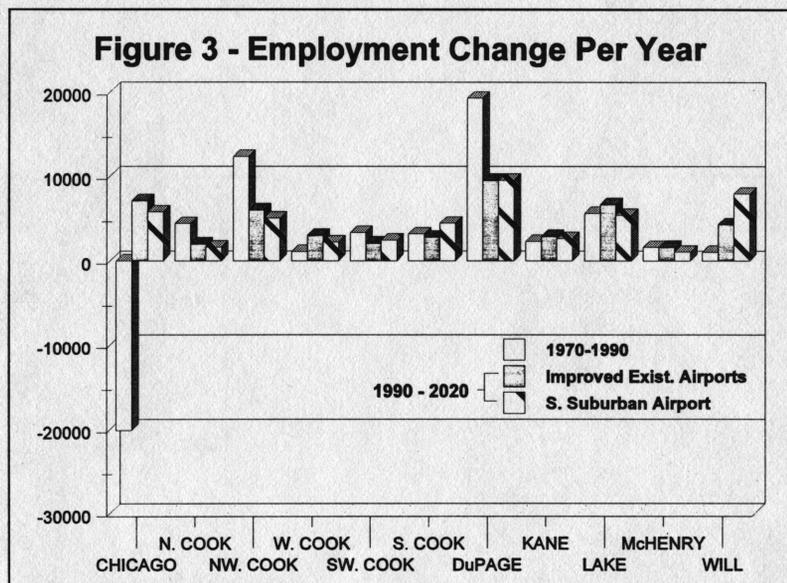

Derived from F1000DE2.DBF
NIPC September 2000

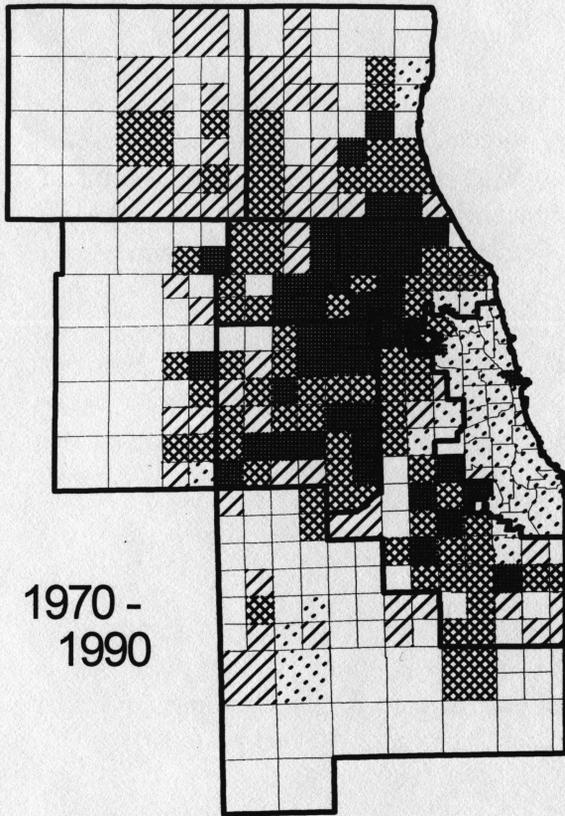

This growth will be sustained not by declines in older communities, as in recent decades, but by region-wide expansion. The overall pattern can be seen in Map Set 1 by visualizing a regional center (Chicago and the adjacent suburban communities) surrounding by three concentric rings. Signs of renewed growth are seen in the center. Population in the first ring will be relatively stable. The second ring, which includes most of the area which has grown most rapidly in the last 20 years, will experience modest growth. Substantial growth will occur in the outer ring. The principal difference between the two airport alternatives is the shifting of growth around the rings toward Will County in the South Suburban Airport scenario.

The revised forecasts of population differ slightly on a county-by-county basis from those endorsed in 1997. These changes reflect differences in actual rates of growth and community plans for the future. The new forecasts are slightly higher for Cook, Kane and Will counties and slightly lower for Lake and McHenry counties. The changes, for the most part, reflect the stabilization of household size in Cook County, accelerating growth in Kane and Will counties, and revised expectations among some local officials in Lake and McHenry counties. The forecast for DuPage County is unchanged.

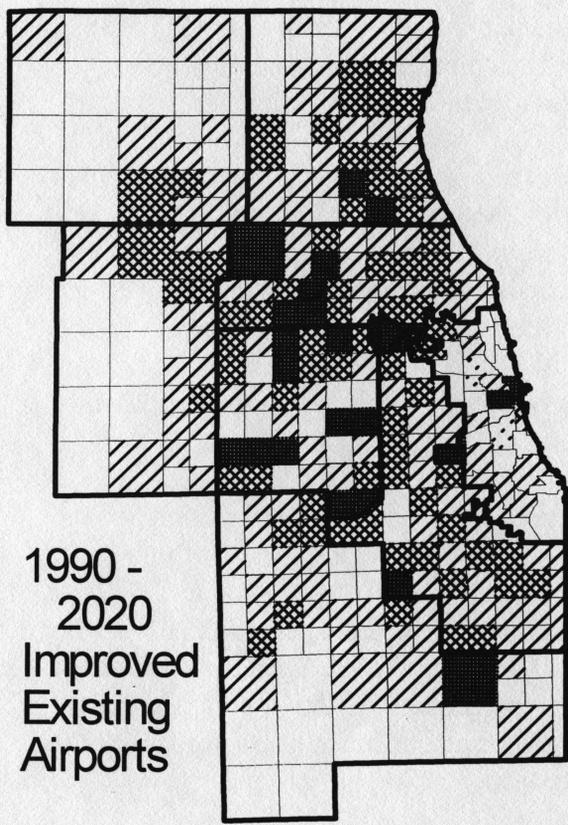

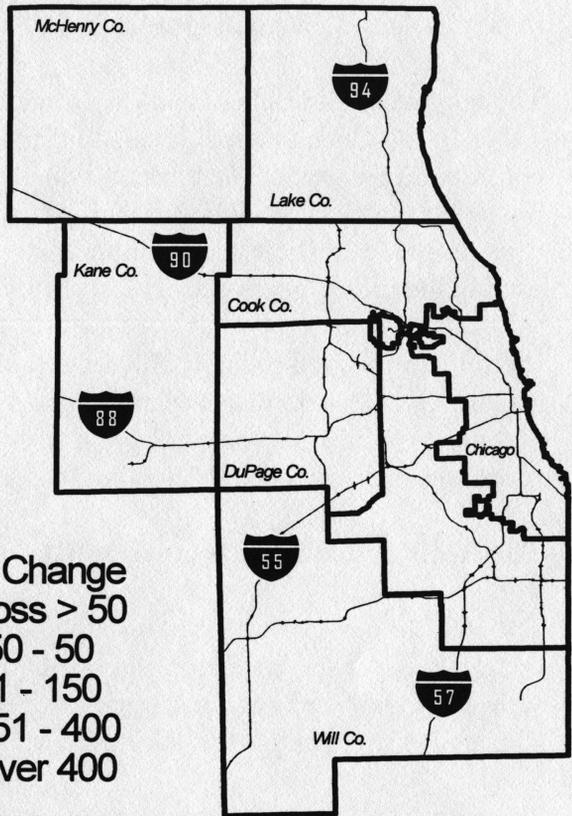

Figure 3 and Map Set 2 show past and forecasted subregional employment growth. As with population, new job growth is distributed throughout the region. This represents a substantial change from experience in the 1970-1990 period, when Chicago and some older suburbs lost large numbers of jobs. Cook County will gain the largest number of new jobs, although fewer than were forecast in 1997. The next highest numerical gains will be found in DuPage and Lake counties. The employment forecasts for Kane, Lake, McHenry and Will counties were all adjusted upward from the 1997 figures. The DuPage County forecast did not change as a result of the update.

South
Suburb
Airport

Derived from F1000DE2.DBF
NIPC September 2000

As in the case of population, the South Suburban Airport scenario shows a marked shift in job distribution toward southern Cook and Will counties. A comparison of Map Sets 1 and 2 will show that in the region as a whole, employment growth does not decentralize as far from the center of the region as does population growth.

The population, household and employment forecasts by county and municipality are presented in Table 1. At the municipal level, adjustments to the 1997 forecasts were made only after careful consideration of critical factors that would indicate a revision was necessary. These factors included post-1996 growth experience, changes in assumptions concerning future municipal boundaries, changes in local official expectations, and the correction of errors in the application of assumptions used in the prior forecasts.

Preliminary revised municipal forecasts were sent to the 270 municipalities in January 2000 for review. Over 90 communities participated in review discussions. In the 1997 forecast round, over 200 communities participated. Most of those earlier inputs were reviewed in preparation of the recommended forecasts.

The Region's Citizens: Increasingly Diverse

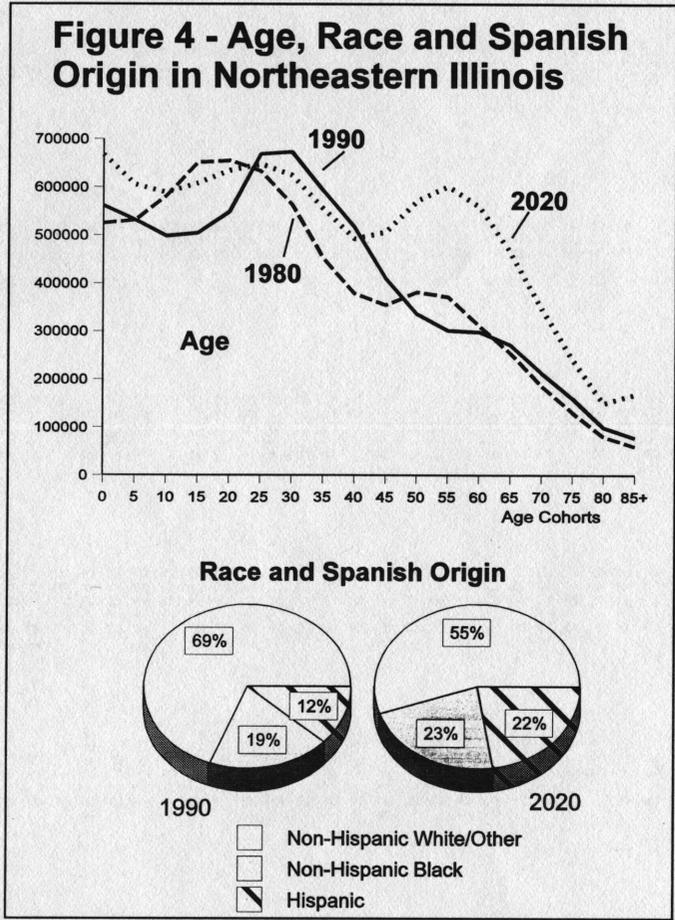

The 1997 forecasts were based on a thorough analysis of birth, death, and migration rates and of the composition of the population in terms of age, race, and Spanish origin. The revisions in the forecasts imply some minor changes in these data. The overall conclusions, however, remain valid. The analysis will be redone during the next forecast cycle based on the 2000 Census results.

The population forecasts assume that white and African-American birth rates will remain constant at 1990 levels and that Hispanic birth rates will decrease slightly. When coupled with the changing age distribution, this will result in a moderate decline in the number of births until the 2003-2006 period, when births will increase. Life expectancy is assumed to increase only slightly across the entire population. With an aging population, a steady increase in the number of deaths is expected.

The pattern of population migration will shift from the substantial net out-migration of the 1970's and 1980's to slight net in-migration during the forecast period. Migration assumptions were chosen to balance the demand for labor reflected in the employment forecast with the supply of labor implied by the population forecast. This balancing process also required assumptions concerning long-term unemployment (6 percent), resident workers holding more than one job (5 percent), and jobs in the region held by non-residents (7.5 percent in 2020). The forecasts assume that labor force participation will increase slightly, and that the baby boom cohorts will choose not to retire as early as prior generations.

Figure 4 illustrates the expected shift in the age distribution and changes in the population by race and Spanish origin. The baby boom population was born between 1946 and 1964 with the peak occurring in 1957. In 1970, that population ranged in age from 6 to 24 with the peak at 13. Most of this group had not entered the labor force. By 1990, the boomers ranged in age from 26 to 44 with a peak at 33 and were entirely in the labor force ages. In 2020, when the youngest of the boomers is 56, the population over 45 will represent a much larger percentage of the population than at present. The disproportionate size of this older segment will be a significant characteristic of the labor force.

Figure 4 - Age, Race and Spanish Origin in Northeastern Illinois

At the same time, the school- and pre-school-age population is expected to grow steadily over the forecast period. This growth will be fueled by the overall growth in population, the higher birth rates of a growing minority population, and the arrival of the baby boomers' grandchildren.

Approximately two-thirds of the region's new residents between 1990 and 2020 will be Hispanic. Over that period, the Hispanic population will increase from 837,000 to slightly over 2 million, an increase of 141 percent. The remaining one third of the region's population increase will be non-Hispanic African-American. This forecast represents a 44 percent increase from 1.41 million in 1990 to 2.03 million in 2020. The corresponding rates of increase projected by the Bureau of the Census for the nation as a whole are 136 percent for Hispanics and 42 percent for African-Americans. NIPC has not prepared forecasts for the Asian-American population, which represents a relatively

small proportion of the population of the six counties. However, this group is likely to grow very rapidly during the 20-year forecast period.

From 1970 to 1990, the average household size in northeastern Illinois fell by over 13 percent from 3.14 persons per household to 2.72. By 2020, this figure should fall only to 2.63. This modest decline (3 percent) will result from changes in the age distribution, shifts in the minority composition of the population, and relatively stable birth rates. Most of the decline in household size will occur toward the end of the forecast period as the baby boom cohorts reach their senior years.
